

# BENEFICIAL NEMATODES

Most of the destructive pests in your garden are born down here in the soil. Our nematodes eat the eggs and larvae before they have a chance to emerge and chew on your plants!

Beneficial Nematodes are microscopic worms that protect your plants from over 230 insect pests. They may look frightful through a microscope, but they're completely harmless to you and your family. Plus, using them is one of the easiest ways to protect your garden's home...the soil. They eat the larvae before they turn into flying destructive pests!
