

GUARDIAN SPECIES:

BENEFICIAL NEMATODES

FIELD PHOTOS:

FIELD NOTES:

Nematodes search out susceptible pests and enter inside them.

▶ Fast, effective control of over 230 soil-dwelling insects

▶ Pro-active soil preparation!
They protect your trees, shrubs, fruits, vegetables and turf before insect pests emerge.

Once inside, they introduce a bacteria that normally kills the host pest in 24 - 48 hours.

▶ They attack pest eggs and larvae (like grubs) without harming earthworms or microbial activity in the soil.

▶ Non-Toxic - Safe for use around children, pets and edible gardens.

With the help of beneficial nematodes we can reduce the populations of plant pests before they have a chance to emerge from the soil. They're an environmentally safe way to protect your plants without the use of pesticides.
